

# Problem Statement and Goals

## Chess Connect

Team #4,  
Alexander Van Kralingen, vankraa  
Arshdeep Aujla, aujlaa4  
Jonathan Cels, celsj  
Joshua Chapman, chapmj3  
Rupinder Nagra, nagrar5

2022-09-26

Table 1: Revision History

Date	Developer(s)	Change
2022-09-26	Rupinder Nagra	Problem Statement, Stakeholders, Environment
2022-09-26	Rupinder Nagra	Goals, Stretch Goals, editing
2022-09-26	Joshua Chapman	Inputs, outputs, goals, stretch goals
2022-09-26	Jonathan Cels	Goals, stretch goals, editing, formatting

## 1 Problem Statement

### 1.1 Problem

Online chess has functionality for both beginners and experienced players to learn and practice the game. However, these forms of learning emphasize a visual style of learning using a standard keyboard and mouse, while physical boards place emphasis on tactile learning when learning or studying the game. The highest-rated chess players often use a combination of the two styles to optimize their play. However, no option exists for players of any skill level to integrate their over-the-board and online play with one solution.

This project plans to centralize these two mediums of studying the game in order to provide flexibility and remove constraints for new players in learning how to play chess.

## **1.2 Inputs and Outputs**

### **1.2.1 Inputs**

- a. Location of chess piece on the board
- b. Type of piece in a board location
- c. Colour of piece in a board location
- d. Experience level of player using the board
- e. Chess engine optimal moves for board state

### **1.2.2 Outputs**

- a. Store current games online
- b. Communicate engine moves to players
- c. Signify possible moves to players

## **1.3 Stakeholders**

This project will assist chess players of any level that are looking for a tool to help them learn and study the game. For beginners, the board serves as a learning tutorial and a general introduction to the game, while intermediate and advanced players can use the engine move recommendations to study new lines, puzzles, and specific positions. In addition to chess enthusiasts, this project will also be relevant to chess tournament organizers looking for a method to easily broadcast and share their games online in real-time.

## **1.4 Environment**

Due to the web application component of our project, many of our languages will revolve around a standard full-stack development tech stack. Because of this, we will be using JavaScript, HTML, CSS, and Python, along with the React framework. React is a front-end framework that encompasses JavaScript, HTML, and CSS.

The Python back-end will use both Node.js and FastAPI. A combination of Python and C will be used to facilitate the transmission of information from the hardware to the web application over Bluetooth. To deploy the web application online we will be using Heroku, a cloud application platform. Unit and integration testing will be done using PyTest, and the React Testing Library and will be implemented as part of the CI/CD methodology. In order to store previous games, we might also make use of databases such as MySQL and MongoDB, relating to some of our tasks in the stretch goals section below.

In terms of the hardware, we are planning to use sensors to track pieces on the board using a microcontroller that will be programmed in C. An LCD display

will show engine moves, where our method of connecting the hardware and software together will be Bluetooth. Thode Makerspace will be utilized as a workspace to build the project.

## **2 Goals**

### **2.1 Live Broadcasting**

Physical chess boards lack the ability to share moves with anyone outside of the room. It also provides an inconvenience to both players and viewers if multiple people wish to view the game being played on a physical board. Chess Connect will be able to provide a live broadcast of the state of the game to a local server that allows anyone to view the game on any device with an internet connection. This prevents any distractions for the players and allows viewers to remain updated with the game. This also allows players to share their game while maintaining the benefits of a physical board.

### **2.2 Engine Integration**

Online chess has taken large leaps in recent years due to chess engine development that can now quickly evaluate the entirety of a game with great accuracy in a small amount of time. However, physical boards lack this real time evaluation, decreasing potential improvement for a player. Chess Connect will fetch the best moves from a chess engine API and display those moves based on the board state through an LCD display attached to the physical board. This will assist a player in recognizing the best moves they can currently play, and also build on their intuition for future moves.

### **2.3 Beginner Mode**

For new players, nothing beats learning on a real board. It reinforces tactile learning and allows for better board vision. There are many nuanced rules of chess and can be difficult for beginners to remember. Chess Connect will display possible moves of individual pieces and notify users when they make moves that break the rules.

## **3 Stretch Goals**

### **3.1 Database**

Providing users the ability to study their past games allows them to learn from their mistakes and blunders in the game. It also allows them to evaluate their own positions with a better understanding on how to play in future games. Using MySQL and MongoDB to store those games in these databases, we can let users look through all games previously played on our board.

### **3.2 Study Mode**

Study Mode will allow users to set up puzzles that do not start from the default position. Instead, study mode will allow users to practice a specific phase of the game, and will include the ability to take back moves without having to play out a full game with an opponent. This mode is meant to be used individually, also allowing a user to use and study the board without the necessity of another player.

### **3.3 Existing Chess Site Integration**

Online chess has extensive communities on existing platforms. To promote code reusability, the Chess Connect online platform will interface with popular existing websites. Users of the board have the capability to share their games with a larger community via these platforms in addition to the custom web application. These sites include, but are not limited to, Chess.com and Lichess.
